With Idaho’s adoption of the 2014 National Electrical Code and its new requirements as expressed in 110.24, the Division of Building Safety has received a number of requests for guidance regarding the calculation of available fault current.

The Division has obtained permission from Mr. John Sokolik to post his digital *Available Fault Current Calculator* on our website. You must have MS Excel in order to access the calculator.

The calculator can be found by clicking here. The program is relatively simple, and includes helpful hints that are available by placing your cursor over any yellow field showing red mark in the upper right corner.

We hope you find this calculator to be helpful.
